University of London

AGENDA

1 Introduction

2 Method

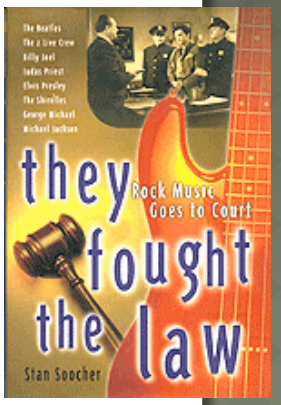
3 Empirical Study

4 Summary/next steps

1 INTRODUCTION

- Melodic Plagiarism: Huge public interest, importance for pop industry – little research

- Exceptions:
  - Stan Soocher: They Fought The Law, 1999
  - Charles Cronin: Concepts of Melodic Similarity in Music-Copyright, 1998



1 INTRODUCTION

- The aim of the study is
  - to explore how melodic similarity as measured by modern algorithms is related to court decisions in individual cases
  - to measure the similarity of the melody pairs in a sample of cases taken from a collection of court cases and
  - to evaluate the predictive power of the algorithmic measurements when compared to the court ruling.

2 METHOD

- 20 cases spanning the years from 1970 to 2005 – with a focus on *melodic* aspects of music copyright infringement.
- *Creation* of monophonic MIDI files,
- *analysis* of the written opinions of the judges,
- *reduction* of the court decisions to only two categories
  - „pro plaintiff“ = melodic plagiarism
  - „contra plaintiff“ = no infringement

BRIGHT TUNES VS. HARRISONGS (1976)

- The Chiffons „He‘s So Fine“, 1963
  - No. 1 in US, UK highest position 11

- George Harrisson, „My Sweet Lord“ Single published in 1971
  - No.-1-Hit in US, UK & (West-)Germany

SELLE VS. GIBB (1984)

- Ronald Selle, “Let It End”

- Bee Gees, “How Deep Is Your Love” (1977)

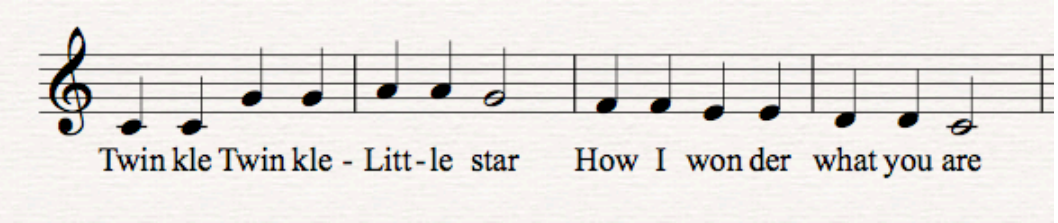
3 EMPIRICAL STUDY

- How do court decision relate to melodic similarity?
- What is the frame of reference (directionality of comparisons)?
- How is prior musical knowledge taken into account?

STATISTICALLY INFORMED ALGORITHMS

- Idea: Frequency of melodic elements important for similarity assessment
- Inspired from computational linguistics (Baayen, 2001), text retrieval (Manning & Schütze, 1999)
- Conceptual Components:
  - *m-types* (aka n-grams) as melodic elements
  - Frequency counts: Type frequency (TF) and Inverted Document Frequency (IDF)

MELODIC ELEMENTS: M-TYPES



Word Type *t*	Frequency *f(t)*,	Melodic Type τ (pitch interval, length 2)	Frequency *f(τ)*,
Twinkle	2	0, +7	1
little	1	+7, 0	1
star	1	0, +2	1
How	1	+2, 0	1
I	1	0, -2	3
wonder	1	-2, -2	1
what	1	-2, 0	2
you	1	0, -1	1
are	1	-1, 0	1

0, -1	1	0.11	0.51	0.0561
-1, 0	1	0.11	0.74	0.0814

TF-IDF CORRELATION

$$\sigma_C(s,t) = \frac{\sum_{\tau \in s_n \cup t_n} TFIDF_{s,C}(\tau) \cdot TFIDF_{t,C}(\tau)}{\sqrt{\sum_{\tau \in s_n \cup t_n} \left(TFIDF_{s,C}(\tau)\right)^2 \cdot \sum_{\tau \in s_n \cup t_n} \left(TFIDF_{t,C}(\tau)\right)^2}}$$

FEATURE-BASED SIMILARITY

Ratio Model (Tversky, 1977): Similarity $\sigma(s,t)$ related to

- # features in *s* and *t* have common
- salience of features *f()*

$$\sigma(s,t) = \frac{f(s_n \cap t_n)}{f(s_n \cap t_n) + \alpha f(s_n \setminus t_n) + \beta f(t_n \setminus s_n)}, \alpha, \beta \geq 0$$

- features => m-types
- salience => IDF and TF
- different values of α, β to change frame of reference
- Variable m-type lengths (n=1,…,4), entropy-weighted average

FEATURE-BASED SIMILARITY

Tversky.equal measure (with $\alpha = \beta = 1$)

$$\sigma(s,t) = \frac{\sum_{\tau \in s_n \cap t_n} IDF_C(\tau)}{\sum_{\tau \in s_n \cap t_n} IDF_C(\tau) + \sum_{\tau \in s_n \setminus t_n} IDF_C(\tau) + \sum_{\tau \in t_n \setminus s_n} IDF_C(\tau)}$$

Tversky.plaintiff.only measure (with $\alpha = 1$, $\beta = 0$)

$$\sigma_{\text{plaintiff.only}}(s,t) = \frac{\sum_{\tau \in s_n \cap t_n} IDF_C(\tau)}{\sum_{\tau \in s_n \cap t_n} IDF_C(\tau) + \sum_{\tau \in s_n \setminus t_n} IDF_C(\tau)}$$

Tversky.defendant.only measure (with $\alpha = 0$, $\beta = 1$)

$$\sigma_{defendant\ .only}(t,s) = \frac{\sum_{\tau \in s_n \cap t_n} IDF_C(\tau)}{\sum_{\tau \in s_n \cap t_n} IDF_C(\tau) + \sum_{\tau \in t_n \setminus s_n} IDF_C(\tau)}$$

Tversky.weighted measure with $\alpha = \frac{\sum_{\tau \in s_n \cap t_n} TF_s(\tau)}{\sum_{\tau \in s_n} TF_s(\tau)}$ and $\beta = \frac{\sum_{\tau \in s_n \cap t_n} TF_t(\tau)}{\sum_{\tau \in t_n} TF_t(\tau)}$

EVALUATION

- Ground Truth:
  20 cases with yes/no decision (7/13)

- Evaluation metrics
  - Accuracy (% correct at optimal cut-off on similarity scale)
  - AUC (Area Under receiver operating characteristic Curve)

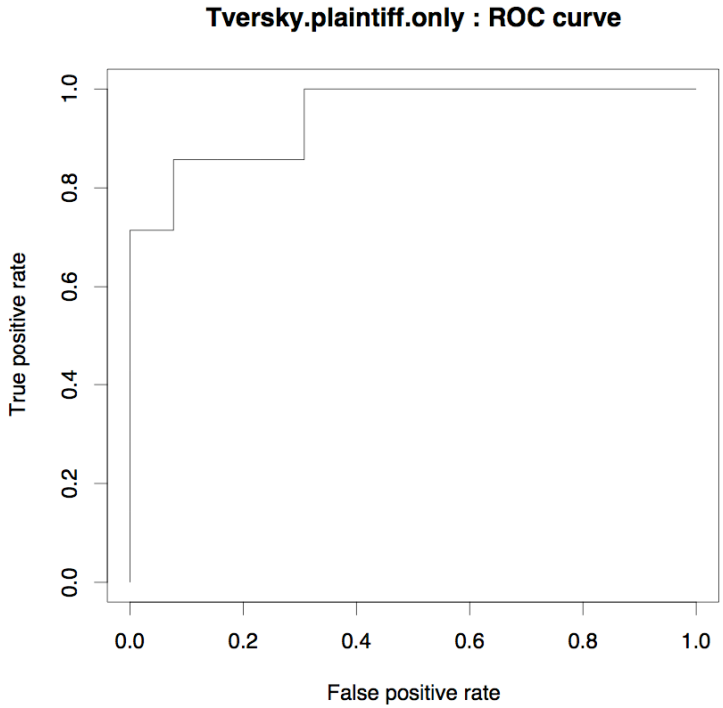
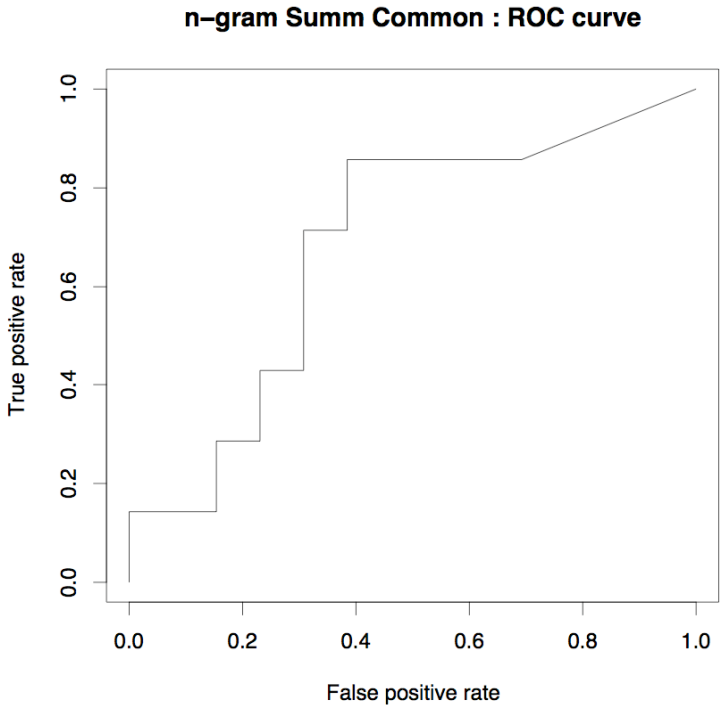
EVALUATION: ROC CURVES





A QUALITATIVE LOOK

Ronald Selle, “Let It End”

Bee Gees, “How Deep Is Your Love”

Observations:

- Decision sometimes based on ‘characteristic motives’
- High-level form can be important (e.g. call-and-response structure)
- Reference point can be different

4 SUMMARY/NEXT STEPS

- Court decisions can be related closely to melodic similarity
- Plaintiff's song is often frame of reference
- Statistical information about commonness of melodic elements is important

4 SUMMARY/NEXT STEPS

- More US cases
- UK and German cases (from the “big” western markets)
- Include rhythm in m-types
- Compare to more similarity algos from literature

Thank you for your attention!
